A trace element is a chemical element whose concentration (or other measure of amount) is very low (a "trace amount"). The exact definition depends on the field of science: In analytical chemistry, a trace element is one whose average concentration is less than 100 parts per million (ppm) measured in the atomic count or less than 100 micrograms per gram.

In the context of nutrition, a mineral is a chemical element required as an essential nutrient by organisms to perform functions necessary for life. However, the four major structural elements in the human body by weight (oxygen, hydrogen, carbon, and nitrogen), are usually not included in lists of major nutrient minerals (nitrogen is considered a "mineral" for plants, as it often is included ...

Minerals serve a variety of structural and metabolic functions in swine and are found in all body components, including bone, muscle, internal organs, blood, and other tissues and fluids of the body. Some minerals are found in relatively large amounts while others are found in minute or trace quantities. Vitamins are another class of nutrients required for normal metabolic functions in the body.

Le terme est introduit par le chimiste Gabriel Bertrand dont les travaux au début du XX<sup>e</sup> siècle montrent l'action de ces éléments sur les sols, les plantes et les animaux, et dont les besoins en quantités infimes les distinguent des « éléments majeurs » ou « macro-éléments » [1]. Les oligo-éléments essentiels répondent aux critères suivants [2] :
